

October 15, 2010

The Base Map Service Center (BMSC) is pleased to announce that the MSDI Structures Framework is now a complete statewide dataset. The Structures Framework is a federated, multi-jurisdictional GIS point database of primary structure locations populated with data created by the BMSC and contributed by local governments and other data providers.

Future plans for the Structures Framework include adding structure addresses and establishing relationships where they don't already exist with local providers of structures and address data to continually update and maintain the Framework.

The Structures Framework is available as a [geodatabase download](#) from the Base Map Service Center's GIS Coordination website and as [web services](#).

For more information, see the GIS Coordination website, the geodatabase metadata or contact the Structures Framework Theme Lead.
